REDD+	Reducing Emissions from Deforestation and Forest Degradation, the role of conservation, sustainable management of forests and enhancement of forest carbon stocks
SAP	Safeguards Action Plan
SESA	Strategic Environmental and Social Assessment
SHEC	Sub-HIA Executive Committee
SIS	Safeguards Information System
UNFCCC	United Nations Framework Convention on Climate Change
WB	World Bank

1.0 INTRODUCTION

The Ghana Cocoa Forest REDD+ Programme (GCFRP) is the premier emission reductions programme fully developed from a 25-year Ghana REDD+ Strategy (GRS) by the Government of Ghana through the Forestry Commission and Ghana Cocoa Board (Cocobod) with funding support from the Forest Carbon Partnership Facility (FCPF) of the World Bank. The programme seeks to significantly reduce carbon emissions resulting from cocoa expansion into forests through the promotion of appropriate climate-smart cocoa production approaches, including intensification and yield enhancement. The programme spans a mosaic landscape that produces commodities of international and national importance; - cocoa, timber, palm oil, food crops. However, the dominant crop in the landscape and also of national importance is the cocoa from which the programme derives the name "Ghana Cocoa Forest REDD+ Programme".

Cocoa is Ghana's most important agricultural commodity, accounting for roughly 57 percent of all agricultural exports and supporting the livelihoods of about 2.5 million rural farmers and their dependents. Cocoa production is predominant in the High Forest Zone (HFZ) of Ghana. The Western Region holds the largest area of remaining primary forest in Ghana and produces over 50 percent of the country's cocoa beans. However, Ghana's forests have come under severe threat from agricultural expansion, which is the major cause of forest loss, mainly being driven by cocoa production. This makes cocoa production the single biggest driver of deforestation in the landscape. Underlying causes for this include: limited financial and technical support for sustainable cocoa production leading to expansion into forest areas; legal disincentives to maintaining trees on farms; a lack of land use planning and landscape management; and a lack of collaboration amongst cocoa stakeholders.

In line with the goal of GCFRP, on-the ground implementation of GCFRP is routed through Hotspot Intervention Areas situated within the GCFRP operational area. The Sefwi Wiawso HIA is one of the designated landscapes where GCFRP implementation is underway with the support of a consortium made up of Forestry Commission, COCOBOD, World Cocoa Foundation (WCF), Rainforest Alliance (RA) and Olam and Partnership for Forests (P4F). The partnership adopts a jurisdictional approach which ensures that all stakeholders across the

cocoa sector commit to and collaborate on achieving Climate Smart Cocoa which is tied to Ghana's Emission Reduction Programme. Key activities implemented in the HIA include restoration (Enrichment Planting, Modified Taungya System, Tree On Farm), livelihoods improvement interventions and Climate Smart Cocoa. All these interventions are primarily aimed at helping farmers with the necessary ecological and economic investments to ensure sustainable optimum cocoa production.

The United Nations Framework Convention on Climate Change (UNFCCC) requirements as stipulated in the Warsaw Framework for REDD+ recognizes that safeguards are a key part of REDD+ implementation and links the Cancun safeguards to results-based payment. This requires that countries implementing REDD+ should demonstrate how they have addressed and respected safeguards through the implementation of their REDD+ interventions. One of UNFCCC key priorities is ensuring that social and environmental safeguards are adhered to, throughout the REDD+ process. In addition, since the Carbon Fund via the World Bank will be purchasing the ERs generated from the GCRFP, environmental and social risks associated with the GCRFP activities would be mitigated and addressed using the World Bank safeguards policies and procedures. To comply with the World Bank's safeguards requirements, Ghana has carried out a Strategic Environmental and Social Assessment (SESA) to better understand the environmental and social concerns of the programme, and to better define the necessary mitigation mechanisms and safeguards compliance issues associated with activities to be implemented in the GCFRP. Specifically, it details the risks and opportunities, and identifies the World Bank Safeguards policies triggered. The SESA report resulted in an ESMF to guide the implementation of the proposed ER programme. The National REDD+ Secretariat (NRS) of the Forestry Commission is responsible for ensuring that mitigation measures and recommendations provided in the ESMF applicable to the ER Programme area are implemented.

Table 1: World Bank Operational Procedures triggered by the GCFRP

World Bank Safeguard Policy	**Triggered under REDD+ in Ghana**

OP 4.01: Environmental Assessment	GCFRP will engage IN activities that use forest resources in the HIAs and potentially impact other environmental areas. These activities may have environmental impacts on a limited scale, but a safeguards screening checklist has been prepared to screen activities under the programme and ESMPs subsequently prepared to guide in addressing or mitigating potential impacts.
OP 4.04: Natural Habitats	Some of the HIAs contain critical ecosystems. GCFRP will enhance the quality of the management of these critical ecosystems and reduce risks associated with cocoa and other agroforestry practices. The ESMP provides guidance on avoiding or mitigating impacts on natural habitats.
OP 4.36: Forest	Forest policy and management are a primary focus of this project, in addition to trees in the agroforestry landscape. The screening done provides guidance on managing forest ecosystems and their associated resource as reflected in the ESMF.
OP 4.09: Pest Management	The project will not directly finance the use of pesticides but will promote integrated pest management (IPM) and climate-smart practices and resilient 'shade' cocoa. The project-specific Pest Management Plan has been prepared. The ESMF provides identification of IPM activities linked to the cocoa enhancement activities. In addition, key environmental and social issues and risks associated with chemical applications in cocoa have been analyzed in the ESMP.
OP 4.11: Physical Cultural Resources	The ESMF and Process Framework incorporate screening to ensure that the project would not have any negative impact on sacred sites. Screening of sites for pilot activities will include specific screening under the ESMF.
OP 4.12: Involuntary Resettlement	No involuntary resettlement is expected. However, as part of plans for ensuring that forests are protected and well managed there will be efforts to reduce encroachment due to expansion of cultivated areas. These restrictions of access will be negotiated with farmers. Inputs and incentives will be offered to increase agricultural productivity within the historical boundaries of admitted farms. Process Framework will be used to guide and ensure participatory processes during implementation.

This Safeguards monitoring report has been developed to demonstrate how environmental and social safeguards requirements of the World Bank were adhered to throughout the implementation of activities/interventions in the Sefwi Wiawso - Bibiani HIA.

2.0 ACTIVITIES/INTERVENTIONS IN SEFWI WIAWSO - BIBIANI HIA

2.1 Restoration Activities

Restoration consists of activities that lead to tree planting in on-reserves and off-reserves. Under the emission reduction programme three main restoration activities are recognised in the HIA namely: Modified Taungya System (MTS), Enrichment Planting and Trees on Farm (ToF).

2.1.1 Modified Taungya System (MTS)

This is a system of agroforestry practice where farmers from fringe communities of Degraded Forest Reserves are allocated degraded areas on reserve to undertake plantation development. In this system, farmers provide labour for the site preparation, pegging, planting and tending of the plantation. The Forestry Commission provided logistics (including; pegs, tree seedling and some other farming tools as well as protective clothing) and technical support to the farmers. Farmers were allowed to grow food crops along with the tree seedlings and harvest the crops for themselves whiles tending the tree seedlings for three to four years when tree canopy closes and crop production becomes impossible under the shade. A Benefit Sharing Plan (BSP) was instituted for the MTS with a proportion of 40%: 40%: 15%: 5% to Farmers, Forestry Commission, Community and Traditional Authorities respectively.

The selection of a community or farmer group for the MTS was based on the following criteria among others:

I. Proximity to the planting site; Since the plantation establishment is labour intensive especially during activities such as site preparation, selection of communities or farmer group was based on their proximity and thus those fringing the Forest Reserves are selected. Another reason was that communities are responsible for ensuring that the plantation and the Forest Reserve as a whole is protected from wildfire, illegality, etc. and so communities fringing the reserve were mostly selected.
II. Willingness to participate: As per the Benefit Sharing Plan, proponents are responsible for their individual roles, thus it requires a willing farmer or a community that understand and are willing to invest and wait for the returns in a long term. Some farmers would prefer to be paid for their labour and forfeit future returns.

III. Previous experience: With the implementation of MTS in Ghana nearing two decades, the FC has had a myriad interactions and engagements with communities fringing Forest Reserves and have institutional memory of committed communities based on their past performance. Thus, the selection criteria of farmers also included past community performance in MTS establishment including their ability to protect previous plantation stands established.

IV. Ability to work on the farm: Selection of farmers was also based on their age and health conditions. Strong adults and youth were preferred regardless of the gender.

2.1.2 Enrichment Planting

Enrichment planting was undertaken in a fairly degraded forest with the aim of increasing tree cover by planting tree seedlings within the forest. This plantation model has introduced valuable species to degraded forests without the elimination of valuable individuals already present. In Sefwi Wiawso - Bibiani HIA, the FC Forest District manages Enrichment Planting activities. In Enrichment Planting, strips of 5-6-meter width are cut through the degraded portions of the compartment along which tree seedlings are planted and nurtured to increase tree density. This work is done under the supervision of Forestry Commission.

2.1.3 Trees on farms (ToF)

This system of carbon stock enhancement focuses mainly on cocoa farms in off-reserve areas that are unshaded or not fully shaded according to the right regime. Farmers were supported and have incorporated trees in their farms to ensure sustainable yield whilst at the same time contributing to climate change mitigation. By incorporating trees on their farms, they contribute to carbon stock enhancement, which serves as a carbon sink.

In executing this model, COCOBOD and private sector cocoa companies supported ToF implementation since it falls directly within their remit although under strong coordination and partnership with the Forestry Commission and COCOBOD. Farmers benefit from agricultural extension services as well as supervision and logistical support. In this HIA, Assin Fosu Forest District, COCOBOD Districts, and NCRC as well as Cocoa companies such as Ecom and Hershey are leading ToF.

2.2 Climate- Smart Cocoa

Climate-Smart Cocoa (CSC) consists of farm-level activities that lead to increased resilience, carbon sequestration and general improvement in the livelihood of farmers. At this, a number of REDD+ partners in the HIA including COCOBOD and the private sector cocoa companies undertake climate-smart related activities. The Ghana Cocoa Board generally term their version of CSC as Productivity Enhancement Programme (PEP). COCOBOD since 2017 has rolled out the PEPs to shore up cocoa production in the country and consolidate its position as the leading producer of premium quality cocoa beans in the world. The objective of the PEPs is to roll out a set of measures that will improve productivity per hectare and increase cocoa production levels well above 1 million metric tonnes per year (versus an average of 800,000 tonnes per year over the last ten years). The PEPs mainly entail measures to sustainably increase plant fertility; develop irrigation systems; rehabilitate aged and disease-infected farms; increase warehouse capacity; and create an integrated farmer database. Some of the activities under PEPs include the following:

- Cocoa Rehabilitation Programme
- Cocoa Diseases and Pest Control Programme (CODAPEC)
- Cocoa HiTech (Fertilizer) Programme
- Free Hybrid Cocoa Seedling Distribution
- Artificial Hand Pollination
- Mass Cocoa Pruning
- Cocoa Management System (CMS)
- Irrigation

1. Irrigation Cocoa Rehabilitation Programme

Under this programme, COCOBOD bears the full cost of the two-year rehabilitation process which involves the cutting of cocoa trees affected by the Cocoa Swollen and Virus Disease (CSSVD), treating whole farms and replanting them with disease-tolerant, early bearing, and high yielding cocoa hybrid cocoa seedlings as well as complementary plantain suckers to

provide temporary shade for the young cocoa seedlings and recommended desirable shade tree species to provide permanent shade for the newly established cocoa.

2. Cocoa Disease and Pests Control (CODAPEC)

COCOBOD introduced the CODAPEC programme (Mass Spraying) in 2001/2002 to control black pod disease and mirids (capsids) to prevent their effects on cocoa production. The programme comes at no cost to the farmer. Only mapped farms in good condition are considered under this exercise. COCOBOD takes full responsibility of carting chemicals to the regions and districts for onward distribution to farmers through various task forces in districts and communities. The chemicals are allocated to farmers to arrange with supervisors of spraying gangs to plan spraying schedules to spray their farms. There are 2 components involved:

- Capsid control
  i. A 7-member spraying gang (supervisor inclusive) ensures two (2) rounds of insecticides application in April/May and September/October respectively.
  ii. Cocoa farmers are then expected to complement the first two (2) rounds with additional two (2) rounds in June and December within a cropping year.
- Black pod Control
  i. The first three (3) rounds of fungicides application spraying are carried out between 3-4 weeks' intervals by COCOBOD in June, July and August/October.
  ii. Cocoa farmers are encouraged to work closely with the gang to identify which periods within the intervals to complement with additional three (3) rounds application of the fungicides

3. Cocoa HiTech Programme

Management of Ghana Cocoa Board (COCOBOD) re-introduced the Subsidized Fertilizer Programme following evidence of widespread theft, nepotism, favouritism diversion and smuggling which characterized the then 'Free Fertilizer Programme' some years ago.The aim of the fertilizer distribution was to restore soil nutrients depletion to enable a smooth process during cocoa production. The Subsidized Programme, which makes use of the private sector in the distribution processes, seeks to ensure availability, equity, and transparency. The introduction of this new scheme, with active private sector participation, has also helped to

create jobs to boost economic growth in the country. Generally, the Cocoa HiTech Programme has a number of benefits including:

- cutting off the needless politicization, nepotism and theft that hitherto characterized the distribution of fertilizers
- stimulating an industry that is one of Ghana's top earners of foreign exchange and accounts for about 7 percent of gross domestic product.
- eliminating market distortions as well as steps to map cocoa farms and soil, improving sector management, upgrading ports and storage facilities and rehabilitate ageing trees.
- enhancing access of the ordinary cocoa farmer to the right fertilizer which will help stimulate productivity and increase livelihood.
- Promoting a subsidized programme, which makes use of the private sector in the distribution processes, ensures availability, equity, and transparency

The mode of distribution of the farm inputs is done through the following processes:

- Farmer based Cooperatives are formed, in order to facilitate equitable distribution of fertilizers. Each farmer must belong to a community farmer based corporative.
- Cooperatives then must apply for the subsidized fertilizers at COCOBOD. Farmers can therefore apply through these approved farmer-based cooperatives.
- Farmers are given a one-year moratorium for the payment of the subsidized fertilizers.

4. Free Hybrid Cocoa Seedling Distribution program

Every year, Ghana Cocoa Board (COCOBOD) through the Seed Production Division (SPD) raises disease-tolerant hybrid cocoa seedlings for distribution to farmers free of charge. The initiative is aimed at increasing cocoa production and incomes of cocoa farmers.

Distribution of the seedlings to farmers is mostly done from May – July every year to enable farmers plant them. The mode of distribution takes the following processes:

- The seedlings are raised by the Seed Production Division (SPD) at over 380 nursery sites established in communities across the cocoa regions.
- The Cocoa Health and Extension Division (CHED) distributes the seedlings using farmer data.

5. Artificial Hand pollination programme

This is done to induce pollination of matured cocoa trees top enhance productivity. The processes involved are detailed below:

- A farm ear-marked for pollination must be pruned two months before it is pollinated
- Transfer of pollen grains is aided by forceps and containers
- Application of fertilizers is essential to support pod setting and development

6. Mass cocoa pruning programme

A strategy to prune all productive cocoa across all cocoa growing regions and districts. To this end COCOBOD has supplied 100,000 motorized pruners to various farmer cooperatives to encourage pruning and weeding/slashing as pruning is the master key that unlocks flowering in cocoa to aid flowering and pod setting. It also helps to reduce the incidence of pests and diseases that affects cocoa farms.

7. Cocoa Management System (CMS)

Popularly known as Cocoa farmer census is a program under which all cocoa farmers are enumerated with their data captured including useful sociodemographic characteristics. Their farm sizes and other farm characteristics are also captured. This data will eventually be the platform upon which essential services like cocoa farmers pension scheme would be rolled out for farmers by COCOBOD

8. Irrigation

Due to climate change and its devastating effects COCOBOD has embarked on an aggressive irrigation programme to bring irrigation to the farm gate of the ordinary cocoa farmer as a climate change mitigating and coping strategy. To this end a lot of boreholes have been sunk and solar powered to irrigate some clusters of farms in the various district. Plans are far advanced to dam some big rivers in the cocoa districts for irrigation purposes.

2.3 Wildlife Conservation and Protection

The Wildlife Division of the Forestry Commission has a mission to ensure conservation, sustainable management and development of Ghana's wildlife resources for socio-economic benefit to all segments of society. Specially, the Division has adopted the following strategies:

- Protect and develop Ghana's permanent estate of wildlife-Protected Areas (PAs).
- Promote management and development of wildlife outside wildlife-Protected Areas.
- Develop Eco- tourism potentials of the PAs.
- Promote the development of wildlife - based enterprises.
- Develop linkages with other agencies and NGOs whose activities impact wildlife.
- Assist local communities to develop and manage own reserves
- Foster closer collaboration with communities closer to PAs through the promotion of community resource management areas (CREMA).
- Promote public awareness and education on wildlife management issues.

In line with the above, in the Sefwi Wiawso - Bibiani HIA, the Wildlife Division at the district level embarks on a number of activities including community education and sensitization, as well as patrolling and monitoring of forest reserves for biodiversity protection and conservation.

2.4 Forest for a Just Future - Green Livelihood Alliance Programme II (GLAII) – Tropenbos Ghana

The goal of this programme is to ensure tropical forests and forest landscapes are sustainably and inclusively governed to mitigate and adapt to climate change, fulfil human rights and safeguard local livelihoods. The programme aims to put local communities in the Sefwi Wiawso - Bibiani landscape at a level of awareness, interest and capacity that drives an increase in tree cover, conservation of existing forests and sustainable or climate-smart agriculture (agriculture being the major livelihood activity in the landscape). The programme seeks to realise these in an environment where environmental rights defenders feel safe to operate and the voices of the ordinary citizens are considered in decision-making processes relating to forests and the environment.

Key activities:

Landscape Level

i. Capacity development for communities on climate-resilient farming practices including restoration of degraded areas and integration of trees in cocoa farms

ii. Promotion of inclusive governance in community/landscape setups that contribute to natural resource management and related decision-making processes.
iii. Pursue actions e.g. institutional capacity, traning, livelihood options, integrated planning, awareness on forst and mining laws, etc. to help halt deforestation that is driven by agro-commodity production (in this case, cocoa) and mining within the Juaboso-Bia and Sefwi-Wiawso landscape.

National Level

i. Lobby and Advocate government (MLNR, COCOBOD, FC, Minerals Commission, etc to make their operations and policies supportive of GLA agenda i.e. tree tenure, wildlife policy, etc.
ii. Engagement with Private firms e.g cocoa, timber, oil palm, etc. on matters of sourcing and illegal cocoa production in forest reserves.
iii. Smallholder farmers will be trained to integrate trees in their farms and apply only approved environmentally safe inputs.
iv. Support and contribute to the creation of an enabling environment where CSOs, local communities (including women and youth) enjoy human rights and safely participate in social movements advocating for sustainable and inclusive natural resource management.
v. Strengthen the capacities of CSOs (including media) to lead environmental social movements and defend environmental human rights.

2.5 Mobilizing more for climate (MoMo4C) – Tropenbos Ghana

This is a project intends to bring together entrepreneurs, firms, policymakers, investors and civil society organizations to make green business propositions that tackle causes and impacts of climate change at the landscape level in developing countries, and to attract investments to implement these initiatives.

Key activities:

Enabling Environment

i. Strengthening Multi-stakeholder Platform (MSP) in JB and SW landscape to understand, acknowledge climate change risk, and promote climate-resilient actions, regulations, and policies.
ii. Strengthening Multiple landscape actors (Small-holders' farmers, communities, public and private sector) change mind-set by adapting and practicing climate-resilient actions.

Business cases

i. Promoting climate resilient business cases available for public and private investors contributing to sustainable development.
ii. Strengthen the capacity of identified groups in financial literacy, entrepreneurship, green-business opportunities, and possible investments in their landscape.
iii. Supporting entrepreneurs and investors formulate bankable business cases and pilots.
iv. Facilitating and supporting entrepreneur, financial institutions, and investors formulate investment action plans for possible business cases in Key Landscape Challenges (cocoa, crop diversification, NTFPs, and others)
v. Organizing green business investment day event to showcase all the bankable green business cases to prospective investors and multiple landscape actors to receive input into the business investment plan and validate the business investment plan.

Harvesting lessons

i. Facilitate opportunities for mutual learning by the alliance from the project intervention in SW and JB landscape

2.6 Working Landscape Programme – Tropenbos Ghana

This programme aims for impacts in terms of sustainable land use, inclusive governance, and responsible finance and business, with an emphasis on local men and women foresters and farmers, communities, indigenous peoples and forest, and farm producers' organizations. The objective is to promote transformational change towards climate-smart landscapes in the forested tropics, to help achieve the climate goals as defined in the Paris Agreement, while also contributing to the Sustainable Development Goals.

Key activities:

Landscape Level

i. Capacity building and informed dialogue facilitation on climate smart practices
ii. Capacity development on climate change mitigation and adaptation (agroforestry, climate smart practices, etc.) while supporting people's livelihoods and sustaining agricultural value chains.
iii. Promoting sustainable land use including diversification.
iv. Promoting responsible finance and business through establishment of VSLAs and financial literacy training.

National Level

i. Supporting Ghana's policy direction and related actions such as the Ghana National Climate Change Policy, the Ghana Forestry Development Master Plan (FDMP), Ghana Cocoa Forest REDD+ Programme (GCFRP) and the Nationally Determined Contributions (NDCs)

2.7 Research for Development and Innovation Agriculture and Learning (ReDIAL) – Tropenbos Ghana

The goal of this programme is to contribute to transformation and innovation in agriculture and food systems in Ghana through action research, application of innovative technologies and organization of farmers and multi-stakeholder platforms. It aims to reduce the challenges in agriculture which lead to post-harvest losses and require time and drudges with the use of women and child labour for threshing activities. The programme seeks to foster innovation for improving soil fertility in Ghana by generating scientific knowledge and data while applying innovative technology to improve the threshing of grains and cereals.

Key activities:

i. Capacity development for communities on climate-resilient farming practices as well as development of climate-resilient agriculture in forest landscapes
ii. Training on climate smart agriculture and providing innovative technologies in farm management eg multi-thresher

iii. Implementation of village savings and loans, landscape restoration and inclusive landscape governance

2.8 Fire Smart Landscape Governance Programme – Tropenbos Ghana

The intervention envisions a wildfire resilient landscape where local actors including communities, statutory & regulatory bodies, and local governments inclusively adopt comprehensive and effective wildfire management approach/ practices to minimise incidence of wildfires and its associated negative imprints e.g. deforestation, loss of lives and property, etc. Tropenbos Ghana is implementing this programme with a set of objectives;

1. Establish a common entry point for negotiating inclusiveness and participation in effective wildfire management between communities, formal (e.g. MMDAs, MLNR-FC & EPA, GNFS, GPS, MoFA, etc.) and informal institutions (e.g. Traditional authorities, Community Fire Volunteers, etc.).
2. Review existing wildfire management practices to ascertain effectiveness of structures, institutional mandate, roles and responsibilities, as well as challenges/ capacity gaps.
3. Negotiate and adopt options for effective and efficient wildfire management approach/practices through multi-stakeholder dialogue, capacity development, and collaborations in target landscapes.
4. Stimulate a national policy, or regulatory, or guidelines on landscape approach to wildfire management.

Key activities:

Landscape level

i. Participatory and collaborative research to review and ascertain effectiveness of existing wildfire governance and management practices including structures (MoPs, Guidelines, Community Fire Volunteers, Statutory bodies, etc.) and institutions (policy, regulatory, etc.).
ii. Joint (multi-stakeholder) identification of niches, consensus building and synergies (among institutions) for the design of landscape approach to wildfire management.

iii. Capacity development (communities, statutory institutions, etc.) for adoption, pilot and upscale of effective and efficient wildfire management approach and practices (i.e. landscape approach) in target landscapes.

iv. Awareness creation for participatory monitoring & evaluation, lobby and advocacy to inform national policy and practice on effective wildfire management.

National level

i. Establish a partnership with the Regional West Africa Fire Management Resources Center (RWAFMRC) as network wing of the Global Fire Monitoring Center (GFMC) for bridging the gap between scientific research findings to policy making, to provide sufficient knowledge for decision making

2.9 Landscapes and Environmental Agility across the Nation (LEAN)

LEAN is a four-year project funded by the European Union's flagship GCCA+ initiative that aims to conserve biodiversity, build climate resilience, and reduce emissions from land-use changes in the savannah, high forest, and transition zones of Ghana—and all while helping local farmers to improve their livelihoods. The project seeks to address three structural barriers that have historically hindered efforts by governments, civil society organizations, and the private sector to halt land degradation and deforestation through the uptake of landscape approaches. First, most stakeholders while interested in conserving natural capital and helping to improve livelihoods, have only had the capacity and knowledge to act within their direct sphere of influence or economic interest and not at broader scales. Secondly, even though there is growing recognition of the importance of working at a landscape level to address sustainability, there has remained a lack of effective tools, resources, and incentives to drive aligned action at such a scale. Lastly, although some multi-stakeholder governance structures have been encouraged, Ghana doesn't have an example to date of one sustainable or self- sustaining landscape governance model for scale up. The project is implementing Integrated Landscape Management (ILM) models in three priority landscapes across the savannah, high forest and transitional ecological zones of the country through functional and sustainable landscape governance structures, market incentives and diversified income-generating activities. By using the landscape sustainability measurement framework

(LandScale), an evidence-based ILM model will be produced for national and regional scale-up. The programme is being implemented by various CSOs/NGOs across the landscapes.

Landscape	**Implementing partner**
Transitional Landscape	Tropenbos Ghana
	Eco-Care Ghana
High Forest Landscape	The Rainforest Alliance
Savannah Landscape	World Vision Ghana

Key activities:

i. Establishment of a participatory landscape management structures that will facilitate easy uptake of Integrated Landscape Management (ILM) technology and innovation.
ii. Working alongside with all stakeholders to mobilize and effectively deploy resources and tools that will support targeted sustainability interventions.
iii. Trainings on Climate smart practice and integrated landscape management systems.
iv. Promoting and implementing alternative livelihood support for smallholder farmers on bee keeping, piggery.
v. Establishing of nursery sites

3.0 UPTAKE OF SAFEGUARDS IN REDD+ PROGRAMMES/ACTIVITIES AT THE HIA LEVEL

Generally, the mix of projects/interventions being implemented in the Sefwi Wiawso - Bibiani HIA have contributed to many transformational positive impacts with minimal risks/impacts. This attests to the fact that stakeholders have taken safeguards adherence extremely seriously following the capacity building/training on safeguards in project implementation. Additionally, community members interacted with during the monitoring exercise attested to the numerous trainings / capacity building opportunities they have received from various stakeholders on a number of topics. The topics include climate-smart cocoa, farmer business school, safe handling of agro-chemicals, proper disposal of agrochemicals, compost/organic fertilizer application, buffer zone protection, wildlife and forest protection, to mention a few. Again, it came to light that there has been deep involvement of local traditional systems and decision-making processes throughout REDD+ related activities fostering many impacts including community ownership and acceptance of the Ghana emission reduction programme. The rights and knowledge of local communities were observed to have been strictly respected including taboos and totems, experience/knowledge in cocoa farming and traditional conflict resolution mechanisms. It worthwhile to share that gender has been progressively integrated and mainstreamed in project implementation by the project proponents.

Furthermore, the non-carbon component of the emission reduction programme has been much emphasized. Greater number of communities have been supplied with farm inputs such as cocoa and shade tree seedlings free of charge to enhance contributions towards emission reductions and yield enhancement.

The adherence of the safeguard in the REDD+ implementation the HIA has helped to maximize both environmental and social benefits with some examples below:

- improved vegetative or tree cover in the project communities
- improved environmental integrity of the project landscape
- Lead to livelihood improvement of beneficiary communities
- improved resilience to climate change
- Encourage knowledge sharing among beneficiaries and communities

- Increased livelihood and economic activities of beneficiary communities
- Enhanced health standards
- Good time management for productive activities
- Reduced conflicts and enhance peaceful co-existence amongst community members
- Accelerated development of communities
- Improved income for farmers

Table 2: Results of monitoring of activities in the HIA

ACTIVITY	RISKS	OP TRIGGERED	MITIGATION MEASURES	INDICATOR/ MEANS OF VERIFICATION	REMARKS
Modified Taungya System	Poor records of primary supply and contract workers	4.01 Environmental Assessment	• Proper records of workers are kept and updated as appropriate	• Records of workers	
	Failure to honour MTS benefit arrangement	4.04 Habitats	• Ensured engagement of MTS beneficiaries on the right percentages due them.	• Records of engagement	
	Unavailability and no/limited use of personal protective equipment	4.36 Forests	• Workers were required to wear suitable Personal Protective Equipment (PPE) as appropriate. • Education and sensitization were done on the need for and proper usage of PPEs	• Records of PPE supply • Confirmation with workers	

ACTIVITY	RISKS	OP TRIGGERED	MITIGATION MEASURES	INDICATOR/ MEANS OF VERIFICATION	REMARKS
	Limited awareness creation programs on health and safety including chemical handling.		• Design and implementation of awareness creation programs to educate persons on protecting workers' health and safety including paying attention to chemical handling was done • Workers were required to wear suitable Personal Protective Equipment (PPE) as appropriate.	• Confirmation with workers • On-site verification with farmers	
	Using chemicals such as weedicides, pesticides, insecticides etc. for land clearing durinh tendering		• Labour-intensive approach using simple farm tools like hoes and cutlass were employed. • Farmers were not allowed to use chemicals in the forest. • Weeding and cutting can decelerate the production of seed and can limit the growth of weeds. • Construction of fire belt to prevent forest fires. • Organic farming practices (planting, nitrogen-fixing species, composing, application of organic fertilizers) were implemented and this helped minimize the use of inorganic fertilizers and	• Training of farmers on farm practices • On-site verification with farmers • Confirmation with workers	

ACTIVITY	RISKS	OP TRIGGERED	MITIGATION MEASURES	INDICATOR/ MEANS OF VERIFICATION	REMARKS
			herbicides that are major contributors to soil and surface water quality deterioration.

Wildlife protection and management	Public health risks resulting from poor beekeeping management practices	4.01 Environmental Assessment 4.04 Habitats 4.36 Forests	• Beehives sited in safe environment away from settlements and people • Protective gears put on when performing operational activities on beehives • Honey extraction equipment kept safe and professionally cleaned during and after use	• State of beekeeping protective gears and extraction equipment • Field observation • Report	

ACTIVITY	RISKS	OP TRIGGERED	MITIGATION MEASURES	INDICATOR/ MEANS OF VERIFICATION	REMARKS
			• Community members sensitized on the locations of beehives • Warming signals strategically placed in locations of beehives to turn off people	• Evidence of warning signals	

NB: With regards to Personal Protective Equipment (PPE), stakeholders are entreated to protect themselves as much as possible even in the absence of industrial grade PPE. That is, clothing that covers every inch of the body like PPE would (long sleeved shirts, jeans, boots/footwear, mask).

4.0 FEEDBACK AND GRIEVANCE REDRESS MECHANISM (FGRM)

NRS has made provisions for FGRM hotlines and stakeholders have been made aware of this through sensitization and awareness creation. While activities are being implemented within the Sefwi Wiawso – Bibiani HIA, there have been a few reports on grievances, and feedback has been received.

Support is provided by private sector, NGOs/CSOs, and other stakeholders necessary for helping local actors submit their grievances.

The ERPD identified potential conflict sources for categorising grievances. The potential conflict sources are;

- Resource use and access
- Land and tree tenure
- Benefit Sharing
- Safeguards
- Participation and inclusiveness
- Capacity-Building

SEFWI WIAWSO - BIBIANI		
Grievance/Feedback	**2023**	
Resource use and access		
Land and tree tenure	1	
Benefit Sharing		**M = 3**
Participation and inclusiveness		**F = 0**
Safeguards	2	
Capacity-Building		
Feedback		

5.0 CONSULTATIONS, TRAININGS AND CAPACITY BUILDING ACTIVITIES

In every engagement NRS has with stakeholders, the opportunity is taken to continuously build their capacities on REDD+ topics and provide updates on activities within the HIA and GCFRP as a whole. Partners also carry out trainings and capacity building activities within the landscape.

Table 3: Consultations, trainings and capacity building activities

INSTITUTION/ FACILITATOR	ACTIVITY	RECIPIENTS
NRS	Strengthening awareness on the benefits-sharing arrangement under the GCFRP. To ensure community led, transparent and participatory approach to the benefit-sharing arrangements, the need for safeguards adherence was emphasized to avoid or minimize any complaints or grievances that may arise during this process.	57 (37 M & 20 F) beneficiaries
	Community engagement on community and farmer benefits. The need for safeguards compliance was heavily addressed and the availability of the FGRM was communicated again	77 (41 M & 36 F) beneficiaries
ECOM	Livelihood improvement: Farmers trained on vegetable production and market linkage to enhance livelihood improvement.	
	Women (economic) empowerment: Farmers trained on financial literacy (P&L)	
	Preserving Ecosystem: Farmers received training on Ecosystem Preservation and Climate Smart Agriculture (CSA)	
	Farmer Field School (FFS):	

	Farmers received training on FFS such as GAP, GEP & GSP. Topics treated include but not limited to; Harvest and post harvest, IPM, soil health, safe disposal of empty agrochemicals containers	
	CLMRS: Awareness creation through training for staff and committees(100% target achieved) Training of farmers on discrimination, force labor, child labor, workplace violence and harassment	
	Gender & empowering youth: Farmers trained on gender policy and youth empowering. Youth farmers trained on financial and business skills	
COCOBOD	Sensitization of farmers on Gender Integration	4,125 (2,513 M & 1,615 F) farmers
	Education on Determinants of Child Labour in Cocoa production/industry	4,132 (2,517 M & 1,620 F) farmers
	Education of communities on Resource Depletion (Illegal logging, Deforestation, Clear cutting)	4,125 (2,513 M & 1,612 F) farmers

6.0 RECOMMENDATIONS AND NEXT STEPS

The proponents of GCFRP as well as implementing partners (from government, private sector and CSOs/NGOs) have exhibited strong dedication to sound environmental and social safeguards measures in the implementation of interventions/activities under GCFRP by demonstrating robust compliance to both national and the World Bank safeguards policies. By involving communities in methods that provide them with environmental and financial benefits, the programme has a strong potential to increase carbon stocks (achieve emissions reductions) in the High Forest Zones by reducing deforestation and forest degradation. Certain negative environmental and social effects (soils, water supplies, biodiversity, and some socioeconomic issues) that result from GCFRP implementation have been identified and mitigated against thereby maximizing the reputational, economic and social benefits of the programme

The recommended mitigation measures are sufficient to protect the environment and promote social growth.

Some recommendations to further enhance programme implementation were drawn based on monitoring of the safeguards implementation:

- There is a need to strengthen partnership and coordination with key stakeholders at the HIA level
- Regular and timely monitoring of activities/interventions undertaken by partners is encouraged
- Continuous stakeholder engagement with project proponents on safeguards implementation is recommended

Annex 4: Forest reserves condition scores and biodiversity assessment

Table 4: Description of Forest Condition score

Score	Designation	Description
1	Excellent	Few signs (<2%) human disturbance, with good canopy and virgin or late secondary forest throughout
2	Good	Less than 10% heavily disturbed. Logging damage restricted or light and well dispersed. Fire damage none or peripheral
3	Slightly degraded	Obviously disturbed or degraded and usually patchy, but with good forest predominant; maximum 25% with serious scars and poor regeneration; maximum 50% slightly disturbed, with broken upper canopy
4	Mostly degraded	Obviously disturbed and patchy, with poor quality forest predominant; 25-50% with serious scars; maximum 75% disrupted canopy or forest slightly burned throughout
5	Very poor	Forest with coherent canopy < 25% or more with half the forest with serious scars and poor regeneration; or almost all heavily burned with conspicuous pioneer species throughout
6	No significant forest left	Almost all deforested with savanna, plantation, or farm; <2% good forest; or 2-5% very disturbed forest remaining; or 5-10% left in extremely poor condition

Table 5: Star rating system for plant species in Ghana

Star Rating	Description
Black	Highly significant in context of global biodiversity; rare globally and not widespread in Ghana
Gold	Significant in context of global biodiversity; fairly rare globally/nationally
Blue	Mainly of national biodiversity interest, e.g., globally widespread, nationally rare; or globally rare but of no concern in Ghana due to commonness
Scarlet	Common and widespread commercial species with potential seriously threatened by overexploitation

Red	Common and widespread commercial species; under significant pressure from exploitation
Pink	Common and widespread commercial species; not currently under significant pressure from overexploitation
Green	Species common and widespread in tropical Africa; no conservation concern
Others	Unknown, or non-forest species

Table 6: Ten most important tree species identified in forest ecosystems

Species	**Frequency**
Celtis mildbraedii	182
Broussonetia papyrifera	107
Triplochiton scleroxylon	106
Nesogordonia papaverifera	77
Ricinodendron heudelotii	69
Calpocalyx brevibracteatus	64
Hymenostegia afzelii	64
Diospyros canaliculata	53
Sterculia rhinopetala	47
Discoglypremna caloneura	40

Table 7: Ten most important tree species identified on cocoa farms

Species	**Frequency**
Morinda lucida	77
Persea americana	57
Citrus sinensis	31
Carica papaya	20
Terminalia superba	18
Milicia regia	16
Antiaris toxicaria	15
Ficus exasperata	15

Ficus vogeliana	12
Holarrhena floribunda	12

Table 8: Red and Scarlet star rating of plant species recorded in the forests

Species	**Star Rating**
Chidlowia sanguinea	Blue
Breviea leptosperma	Blue
Xylia evansii	Blue
Afzelia bella	Red
Amphimas pterocarpoides	Red
Anopyxis klaineana	Red
Antrocaryon micraster	Red
Canarium schweinfurthii	Red
Ceiba pentandra	Red
Celtis zenkeri	Red
Daniellia ogea	Red
Distemonanthus benthamianus	Red
Guarea cedrata	Red
Lovoa trichilioides	Red
Mansonia altissima	Red
Piptadeniastrum africanum	Red
Pycnanthus angolensis	Red
Terminalia superba	Red
Albizia ferruginea	Scarlet
Antiaris toxicaria	Scarlet
Entandrophragma angolense	Scarlet
Entandrophragma candollei	Scarlet
Entandrophragma cylindricum	Scarlet
Entandrophragma utile	Scarlet
Guibourtia ehie	Scarlet
Khaya grandifoliola	Scarlet

Khaya ivorensis	Scarlet
Milicia excelsa	Scarlet
Milicia regia	Scarlet
Nauclea diderrichii	Scarlet
Pouteria altissima	Scarlet
Pterygota macrocarpa	Scarlet
Tieghemella heckelii	Scarlet
Triplochiton scleroxylon	Scarlet

Table 9: Red and Scarlet star rating of plant species recorded in cocoa farms

Species	**Star rating**
Pycnanthus angolensis	Red
Albizia ferruginea	Scarlet
Antiaris toxicaria	Scarlet
Entandrophragma angolense	Scarlet
Khaya grandifoliola	Scarlet
Milicia excelsa	Scarlet
Milicia regia	Scarlet
Milicia regia	Scarlet
Pouteria aningeri	Scarlet
Pterygota macrocarpa	Scarlet
Triplochiton scleroxylon	Scarlet

Table 10: Red and Scarlet star rating of plant species recorded in the cropland

Species	**Star rating**
Afzelia bella	Red
Amphimas ptrecapioides	Red
Ceiba pentandra	Red
Celtis zenkeri	Red
Daniellia ogea	Red

Distemonanthus benthamianus	Red
Pouteria altissima	Red
Pycnanthus angolensis	Red
Terminalia ivorensis	Red
Terminalia superba	Red
Albizia ferruginea	Scarlet
Antiaris toxicaria	Scarlet
Entandrophragma angolense	Scarlet
Entandrophragma candollei	Scarlet
Milicia excelsa	Scarlet
Milicia regia	Scarlet
Pterygota macrocarpa	Scarlet
Triplochiton scleroxylon	Scarlet

Annex 5: List of approved and banned agro chemicals

TRADE NAME	ACTIVE INGREDIENT	PRE-HARVEST INTERVAL	RE-ENTRY INTERVAL	DOSAGE
AKATE MASTER	*BIFENTRIN*	21 DAYS	48 HRS	100 ML/ 11L of water
AKATE STAR 3 EC	*BIFENTRIN*	21 DAYS	48 HRS	20 ML/ 11L of water
ACTARA	*Thiamethoxam*	21 DAYS	48 HRS	17ML/11L of water
ACETA STAR	*Acetamiprid&Bifenthrin*	21 DAYS	48 HRS	120ML/11L of water
ACATI POWER	*Thiamethoxam*	21 DAYS	48 HRS	20ML/11L of water
PRIDAPOD	*IMIDACLOPRID*	21 DAYS	48 HRS	20ML/11L of water

List of banned agro-chemicals

GAMALIN 20 (DDT)

UNTENT

COCOSTAT

KABAMALT

PARAQUATS

Banned pesticides

1. 2,4,5-T and Its salts and esters

2. Aldrin

3. Binapaeryt

4. Cantalo

5. Chlordane

6. Clordinciorn

7. Chlorobenzilate

8. Dichlorodiphenyitrichloroethane(DDT)

9. Dieldrin

10. Dinoseb and its calts and esters

11. Dinitro-orthocresol (DNOC) and its salts (such as ammonium salt, potassium salt and sodium salt)

I2. Endria

13. HCH (aixed isomere)

14. Heptachlos

15. Hcxachlorobenxene

16. Parathion

17. Pentachlorophenol and its salts and esters

18. Toxaphene

19. Mirex

20. Methamidophos (Soluble Iquid formulations of the substance that exceed 600 g active ingredient/I)

21. Methyl-parathion (emulsifiable concentrates (EC) with at or above 19.5% active ingredient and dusts at or above 1.5% active ingredient)

22. Monocrotophos (Soluble liquid formulations of the substance that exceed 600 g active ingredient/D

23. Parathion (all formulations - aerosols, dustable powder (DP), emulsifiable concentrate (EC), granules (CB) and wettable powders (WP) - of this substance are included, except capsule suspendions (CS))

24. Mosphamidon (Soluble liquid formulations of the substance that exceed 1000 1 active ingredient/I)
